

Energy policy

Energest srl is an Energy Service Company (ESCo). Our goal is to achieve as much as possible energy efficiency for ourselves and for our customers and to project, build and install renewable energy systems in order to spread sustainable development ideas .

Our energy policy is applied to ourselves in first place, both to our offices in Ostia and to all the activities we do for our customers.

Since we are licensed from the AEEG, the Authority for Electricity and Natural Gas, we satisfy all the legal and quality requirements and we operate in compliance to the UNI 11352 which defines the minimal standards of energy efficiency services provided by an ESCo in terms of organization, auditing, projecting, managing and of economic and financial capacity.

In order to strengthen our effort to offer highly skilled services in the energy efficiency and renewable energy fields, we decided to implement and maintain an Energy Management System compliant to the BS EN 16001:2009 standard. We are the first ESCo in Italy to achieve such a result.

Therefore our targets related to energy use are the following:

- continual improvement of performance in the use of energy both for us and for our clients;
- continual monitoring of energy aspects and indicators;
- involvement of all our staff members and of our partners in our energy policy and in the implementation and maintenance of the EMS;
- dissemination of energy saving and green energy production culture among people;
- implementation of green procurement policies in order to choose partner companies and products that are compliant to our energy policy.

In order to meet and maintain these objectives the whole company, starting from the management, will do its best effort and all the necessary human and economic resources will be allocated.

Our will is to verify periodically the actual achievements of the expected targets and to revise our energy policy and our objectives in consideration of the results we obtained, always in consideration of the idea of improving continually.

Energest is ready to approach this challenge with the same enthusiasm and passion that brought us to be an important part in the energy efficiency and renewable energy field.
